

### Remarks

Careful consideration has been given the Official Action dated July 27, 2006 in preparing this amendment. Reconsideration of Claims 1-21 is respectfully requested in light of the foregoing amendments and the remarks which follow.

The present invention is directed to a device for steadying a video camera during its operation. When secured rigidly to a platform (ala Reese et al. or Wu et al.) the camera will bounce in synchronization with the hand/support which holds it. Applicant's device steadies the camera during filming by permitting the camera and its support platform to pivot under the influence of a gravity-influenced counterbalance, on a Teflon bushing. The socket freely pivots about the ball under the force of gravity to maintain the platform (and, hence, the camera) level within the roll, pitch and yaw limits specified in the claim. There is no means to lock the upper member relative to the lower member. To do so would interfere with the operation of the device. The Examiner appears to misperceive how Applicant's device works leading to the misapplication of these references in rejecting allowable Claims 1-21.

The Examiner has now made the Election of Species is made final. The undersigned, therefore, reiterates that the hands-free unit of Figs. 8 and 9 is not a species of the claimed invention but is, rather, an accessory attachable to, and usable with, the platform of Figs. 1-6. It therefore has a combination, sub-combination relationship to the device set forth in Claim 1. The MPEP §806.05(a) details the handling of combination/subcombination restrictions. It provides in pertinent part "The inventions are distinct if it can be shown that a combination as claimed....(B) the subcombination can be shown to have utility either by itself or in another materially different combination." While this is true for independent Claim 15, it cannot be said for dependent Claims 9-14 and, therefore, the "species" (restriction) requirement is improper. Accordingly, where, as in the case of Claims 9-14, the features of the hands-free unit are claimed in conjunction with the features of the steadying platform (as dependent claims), the features of the accessory should be examined on their merits. In any event, it is respectfully submitted that, in that generic Claim 1 is allowable, the election should be withdrawn and the claims allowed as a group.

Claims 1-4, 6-8 have been rejected under 35 USC §103(a) as unpatentable over Reese et al.

in view of Wu et al. It is the Examiner's position that

The patent to Reese et al. discloses a camera steady device 10 having a support platform (20) and a support shaft (16a, 18) connected to the bottom surface of the platform, having a first upper portion (16), and a separate second lower portion (18), the first and second shafts being positionable within 60 degrees relative to each other and a locking mechanism (24) to lock them in place, a sphere (30) affixed to the upper portion of the support shaft (16a, 18) a socket with a handle (32a, 32b, 16) which has a straight portion and an [sic] fifteen degree angled portion (See Drawing Below), the socket which is permitted to freely pivot about the sphere, a range of plus or minus 60 degrees about a roll and pitch axis and plus or minus 360 degrees about a yaw axis by being, [?sic] the socket which has a first upper plate (32b) with a first downwardly directed truncated spherical recess, and a second lower plate (32a) with a second upwardly directed truncated spherical recess, which pivotally captures the sphere (30).

Reese does teach a counterbalanced socket plate member connected to the bottom portion of the support shaft and a means attachable to socket plate to by [sic] which the support platform is suspended or a and [sic] means (48) for attaching a video camera.

Wu et al. shows a camera steady device for a video camera (60) and a means for attaching (341) the camera, which has a sphere attached to support shaft (20) which has a counterbalancing socket plate member (12) connected to a bottom portion of the support shaft (20) and a means (13) attachable to socket plate to by [sic] which the support platform is suspended, used to firmly hold the video camera to the device and to suspend the device from a support surface. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made from the teachings of Wu et al. to have added these things to the device of Reese et al. in order to firmly attach the camera to the device and to suspend the device from a support surface. [What!?!]

As best understood and as it may be applied to the amended claims, this rejection is respectfully traversed.

As intimated, supra, Reese et al. and Wu et al. are directed to platforms which can be locked in a fixed position relative to a support member. Neither is for use with a hand-held video camera. Reese et al. is intended for use with a computer screen while Wu et al. is designed for use with a still (not a video, or motion picture, camera). Applicant's socket pivots freely relative to the supporting sphere "at all times" as is currently set forth in Applicant's amended Claim 1. It is never locked down; there is no mechanism present for locking. The locking mechanism of Claim 3 is for locking the two portions of the support shaft relative to each other so the camera can be positioned with a certain orientation, the force of gravity retaining it in that orientation in spite of the jostling associated with the walking of the cameraman. Contrary to the Examiner's assertion, there is no

balance plate connected to the "lower portion of said support shaft to help counterbalance a weight of the camera" in the Reese et al. device. Further, it is unclear what "things" the Examiner wishes to transplant from Wu et al. to Reese et al.

Claim 5 has been rejected under 35 USC §103(a) as unpatentable over Reese et al. in view of Wu et al. and Donahue. It is the Examiner's position

Reese et al. and Wu et al. disclose applicant's basic inventive concept, all the elements which are shown above with the exception that it does not show that the sphere is made of Teflon. Donahue shows [ still sic] a joint having a sphere (62) that is made of Teflon, used for its low friction properties (See Col. 6, lines 20-24 for material selection). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made from the teachings of Donahue to have made the sphere of Teflon in order to have a low friction joint.

As it may be applied to the amended claims, this rejection is respectfully traversed.

The addition of Donahue to Reese et al. in view of Wu et al. does nothing to remedy the deficiencies of the primary rejection with regard to the limitations of parent Claims 1, 4. Further, while the use of a TEFLON ball for low resistance is not novel, there is no teaching or suggestion to use such a low resistance ball for a pivot of a standing platform for a hand-held video camera, in the manner of the teaching of the present invention. Accordingly, it is respectfully submitted that this rejection is ill-founded and should be withdrawn.

It is respectfully submitted that Claims 1-21 meet the formal requirements set forth in 35 USC §112, define around the art of record and are, therefore, in condition for allowance. Early indication of allowability is earnestly solicited.

Respectfully submitted,

A handwritten signature in black ink, appearing to read "Richard K. Thomson". The signature is fluid and cursive, with a long, sweeping underline.
